
THE BEGINNING

Module 14

Production & Scaling — Tier 3: Advanced

1. Batch Printing

Printing multiple copies or multiple parts in a single job — arranging models efficiently on the bed to maximize output per print run.

2. Print Farms

Running multiple printers simultaneously to scale output — common once you move from personal projects to small-batch production or selling prints.

- Centralized job queuing across multiple machines
- Remote monitoring (cameras, print-failure detection)
- Standardizing settings/profiles across identical machines for consistency

3. Efficiency Considerations

- Filament cost and waste tracking at scale
- Print time vs. throughput tradeoffs
- Maintenance scheduling across multiple machines

End of Module 14 — Next: Module 15, Monetization & Publishing
