

Module 8

Advanced Slicer Settings — Tier 2: Intermediate

1. Support Strategies

- **Normal supports** — grid-style, strong but harder to remove cleanly
- **Tree supports** — organic branching supports that use less material and are easier to remove, ideal for organic/curved models
- **Support blockers** — manually mark areas to prevent unnecessary supports the slicer over-generates

2. Multi-Material / Multi-Color Printing

Systems like AMS (Bambu) or multi-material units let you print with multiple filaments in one job — for color changes, dissolvable supports, or mixed material properties.

- Dissolvable supports (like PVA) let you print complex overhangs and just dissolve the support away in water
- Color changes let you skip manual painting for multi-color designs

3. Seam Placement

Each layer has a start/stop point (the seam), which can leave a visible line. Slicers let you control where it's placed — hide it on a back edge or corner for cleaner-looking prints.

4. Ironing & Surface Finish

Ironing re-passes the nozzle over top surfaces at low flow to smooth them — useful for flat-topped display pieces.
